

## Conclave

A platform for developing applications that prove how data is used •

Data sharing across firms and departments is key to unlocking greater potential, analytics and insights. However, it remains one of the more difficult things organizations can do because of an inherent mistrust in how data is processed and used.

In today's digital climate, businesses demand more than a privacy policy or the promise of a firm's reputation to feel comfortable sending private data to a third party. Instead, they want to know exactly how their data is being used—all without giving up any control.

That's why R3 developed **Conclave**—a new platform that simplifies the development of applications that provide transparency into how data is collected and processed. Conclave is the ideal solution for software vendors, data service providers, exchanges, corporates and other firms looking to solve the data privacy challenge. Unlike existing data processing solutions on the market, Conclave enables customers to securely send data and verify how it is being used while maintaining ownership and control of their data.

## conclave

### Build next-gen data-protecting solutions with Conclave

Without inherent trust, there are limits to the types of solutions firms can build. There are also limits to their ability to enter new markets, pass along innovation and insight to their customers, and gain greater potential from existing data solutions.

Conclave opens several business use cases for software vendors to process previously inaccessible data and build high-value analytics solutions. For example, they can now use Conclave to capitalize on:

- Fraud Detection
- Market Data Aggregation
- Private Order Matching
- Analytics Solutions

With cutting edge privacy-enhancing technology, the Conclave platform paves the way for a new generation of trusted and shared data services that unlock greater business value.

A survey conducted by Harris Poll shows that only 20% of US consumers “completely trust” the organizations they interact with to maintain the privacy of their data.

## Fraud Detection

### Challenges:

- Fraud that is spread across multiple institutions often remains undetected as there has been no way to securely pool multiple private data sets from industry participants to identify and prevent fraud.
- There are limits to the types of services that fraud detection software vendors can provide as there are data privacy regulations and concerns with sharing confidential customer data with a third party.

**Solution:** Conclave enables fraud detection software firms to access these private data sets by providing assurances to their customers that their data will not be viewed by the provider or the provider's other customers, just processed. As a result, these software firms can build new solutions that aggregate data from multiple firms in a trustworthy manner, while reducing false positives and detecting new fraud.

## Market Data Aggregation

### Challenge:

- Firms need to know how big their market is in order to calculate their own market share and forecasts, however, they do not feel comfortable sharing proprietary sales data such as new and recurring license revenue with a third-party provider.

**Solution:** Conclave enables firms to securely upload revenue and other proprietary sales data to a service that calculates relevant statistics, all without allowing the operator of the system to see the raw data, saving time and costly development resources.

## Private Order Matching

### Challenge:

- Traders often want to do price discovery and order matching privately, and also want to make sure that no one—not even the market operators—can misuse their private transaction details.

**Solution:** Conclave enables firms to build private order matching solutions that give assurances that private transaction data will not be viewed or misused. As a result, software firms can build solutions that protect market participants' data, giving traders and regulators confidence that they are trading in a fair and transparent marketplace.

## Analytics Solutions

### Challenge:

- Companies want to benefit from insights that Analytics and AI firms can provide, but do not feel comfortable sending confidential data outside of their organization, or having it pooled with their peers.

**Solution:** Conclave enables Analytics and AI firms to deliver solutions that provide transparency into how data is processed and assurances that customer data is protected. This enables end users to benefit from insights derived from analytics solutions without having to compromise on data privacy. Software firms can either build new solutions or develop on existing analytics solutions and run them across new private data sets.

## Why Conclave?

With Conclave, independent software vendors (ISVs) and service providers can build trusted, shared data services that combine information from multiple parties to address new use cases and enable cross-company collaboration.

**Figure 1** highlights the opportunity for ISVs to securely pool data from multiple customers and provide new solutions based off that pooled private data. Here we see clients first validating that they are talking to a 'secure enclave' that is running a specific algorithm that they have already decided they trust. Then, they upload their sensitive data to be pooled with that of other clients, safe in the knowledge that it will be processed only as agreed.

**Figure 1: Multi-party data pooling**

## Confidential Computing

Conclave harnesses the capabilities of Confidential Computing and uses Intel® SGX, a Trusted Execution Environment that prevents the owner of a computer from influencing the enclave to do anything other than what it was written to do or seeing the data it is operating on.

Trusted Execution Environments (TEEs) allow programs to run inside secure enclaves which are isolated from the rest of the computer on which they run. TEEs ensure that data and code can be processed without the owner of the computer gaining access to the raw data. As a result, programs are resistant to physical and software attacks by the owner or operator of the computer, as well as by outside parties.

R3 joined the Linux Foundation's **Confidential Computing Consortium** in 2020 and is proud to sit alongside our peers as we work together to accelerate the acceptance and adoption of Confidential Computing in the marketplace.

## Who can benefit from Conclave?

Conclave is for firms who want to build products and services that provide transparency into how data is collected and processed. The businesses who are end-users of Conclave-based applications also benefit as their data is protected from misuse and they are able to retain ownership and control of their data.

Conclave is also for software firms who are in the process of selecting a platform on which to build multi-party AI and analytics solutions. Firms can either build new solutions or develop on existing solutions and run them across new private data sets.

## Which types of institutions can be transformed by building on Conclave?

- Financial Services firms
- Analytics firms and companies leveraging AI
- Data service providers
- Exchanges
- Fraud detection and compliance software firms
- Corporates
- Regulators

## Key benefits of Conclave

- Access previously inaccessible client data to discover new insights
- Deliver collaborative data services to grow and differentiate your business
- Monetize data-driven insights without sacrificing an individual's privacy or an institution's processes
- Reduce the risk of third-party misuse of customer data
- Simplify building of a privacy-preserving application to collect and process confidential data from customers
- Benefit from cutting-edge technologies such as Confidential Computing to secure data at the hardware level
- Provide high-value analytics to customers by building apps on a platform that assures multi-party data privacy

## Key features of Conclave

**Developer-friendly:** A high-level, intuitive API brings the world of trusted execution to regular business developers who can write applications on any operating system (macOS, Linux, Windows)

**Java-based:** Enjoy the ease, productivity and safety of coding on JVM + the ability to build tamper-resistant server applications

**Conclave Mail:** Safely send private data to secure enclaves for protected data processing

**Integration with Corda Enterprise:** Conclave is available as a stand-alone offering and will be integrated with R3's flagship enterprise blockchain platform soon

## About R3

R3 is an enterprise software firm that is pioneering digital industry transformation. We deliver purpose-built blockchain technology for all types of businesses in all industries.

Developed in collaboration with our ecosystem, our enterprise blockchain platform Corda is transforming entire industries by digitalizing the processes and systems that firms rely on to connect and transact with each other. Our blockchain ecosystem is the largest in the world with more than 350 institutions deploying and building on Corda Enterprise and Corda. Our customers and partners have access to a network of leading systems integrators, cloud providers, technology firms, software vendors, corporates and banks.

To ensure our customers derive the greatest value from their investment, we provide services and support to shorten time-to-market, as well as guidance on implementation, integration and building ecosystems based on a blockchain platform.
